

Task3

1.Explain the importance of inline, internal and external CSS.inline

INLINE CSS: the inline css is used to give a style to a particular element and to differentiate it from the other elements. It is used by giving the style attribute for very quick and fast styling

Technical example: <p style="font-size: 18px; background-color: lightyellow;">

INTERNAL CSS : the internal css is used to group or map different kinds of elements and add a style to every thing within the html document by giving a <style> tag . some syntax for css styles are | .for clas, #for div This way, the styles apply to the whole page but are kept in the same file as the HTML, Technical example: <style>

```
body {    background-color:
#f0f0f0;    font-family: Arial,
sans-serif;
</style>
```

EXTERNAL CSS: the external css is used when there are multiple pages embedded within the same html document such as for example : homepage services about help etc. in this case for each and every page the external css will be used and linked with the page accordingly to avoid clutter and makes the page clean and understandable for the programmer

Technical example: link rel="stylesheet" type="text/css" href="styles.css">

2.submitted as gitlink and screenshot
